d = 10 - 15: 1 goes to the next higher place, d - 9 in current place

Alternately $d + 6 \mod 16$ in current place, if $d \ge 10$

d = 12: $d + 6 = 18 \mod 16 = 2$, 1 goes to next higher place $12_{10} = 1100_2$, 1100 + 0110 = 10010

NB: LSB is unaffected, because LSB of $6_{10} = 0$ If bits are handled sequentially, 3 can be added (instead of 6) and then shifted left

of 6) and then shifted left

```
d = 0 - 9: binary and BCD are identical
```

d = 10 - 15: 1 goes to the next higher place, d - 9 in current place

Alternately $d + 6 \mod 16$ in current place, if $d \ge 10$

d = 12: $d + 6 = 18 \mod 16 = 2$, 1 goes to next higher place $12_{10} = 1100_2$, 1100 + 0110 = 10010

If bits are handled sequentially, 3 can be added (instead of 6) and then shifted left

$$110 + 011 = 1001 \longrightarrow 10010$$

To be repeated until conversion is complete

- Binary coding scheme for decimal digits
- Sequence of bits x₃x₂x₁x₀ (say) for N is it's code word
- Each position *i* may have a weight w_i (weighted code); $N = \sum w_i x_i$
- For BCD $w_3 = 8$, $w_2 = 4$, $w_1 = 2$, $w_0 = 1$
- Sum of weights is 9 for self-complementing code

- Excess-3, Cyclic and Gray codes are unweighted codes
- Excess-3 code is formed by adding 3 (0011) to the BCD value
- It's is self-complementing $(\frac{n+3}{n+3} + \frac{(9-n)+3}{n+3} = 15)$
- Adjacent code words of a cyclic code differ only in one place in the range
 0..9, also, 0 and 9 are adjacent
